

Bewertung von GitLab-Tickets

Code T-001 Datum 18.08.2026

☒ Ich nehme freiwillig teil. Angaben ohne Namen, nur für die Bachelorarbeit.

Rolle: ☒ Entwicklung ☐ QA / Test ☐ Product Owner ☐ andere: _____

Sie bewerten drei Tickets. Jeweils zuerst den Ausgangstext, dann Rückfragen und Antworten, dann den aufbereiteten Text. Pro Zeile ein Kreuz. 1 = stimme gar nicht zu, 5 = stimme voll zu, k. b. = kann ich nicht beurteilen. Dauer etwa 15 Minuten.

Ticket 1 · Funktionserweiterung

Ausgangstext

Titel. Screenshots in the ticket are ignored

Beschreibung. @dev-assist

If an issue has a screenshot attached, Dev-Assist somehow does not use it. That should work better.

Rückfragen und Antworten

Dev-Assist: More information needed

1. Should screenshot support apply only to attachments on the main issue, or also to images added later in comments?
2. Should Dev-Assist surface screenshot findings explicitly in the generated ticket text, or use them only internally to improve analysis quality?

Antworten

1. Screenshot support should apply to attachments and comments.
2. The screenshots should surface in the generated ticket.

Aufbereiteter Text

Titel. Use issue screenshots in Dev-Assist analysis

Description. Dev-Assist should include screenshots from both the main issue and later comments when analyzing a GitLab ticket so that visual information is not ignored during ticket generation. The generated ticket should explicitly surface relevant findings from screenshots instead of using them only internally. Scope includes collecting screenshots attached to the issue description and comments and reflecting meaningful visual findings in the structured ticket text when they add functional or contextual value.

Acceptance Criteria. Screenshots in the main issue content are used during analysis instead of being ignored. Screenshots in comments are included in the analysis scope. Relevant screenshot findings appear in the generated ticket when they affect problem, requirements, scope, or acceptance criteria. If both text and screenshots are present, the output combines both sources. If no screenshots are present, the existing text-only flow continues without regression.

Technical Context & Logs. The current issue reports that Dev-Assist does not use screenshots attached to GitLab issues. Clarification: support must apply to attachments on the main issue and to images in later comments, and findings should surface in the generated ticket text. Assumption: screenshot handling may depend on whether the active analysis path can receive image inputs or extracted image context in addition to text.

Proposed Solution. 1. Extend issue and comment context collection so screenshot attachments and embedded images are detected. 2. Normalize screenshot references into the analysis context. 3. Update the analysis flow so screenshot content is available alongside text, using image input or a fallback. 4. Reflect relevant screenshot findings in description, acceptance criteria, or technical context. 5. Add tests for screenshots on the main issue, in comments, mixed cases, and the path without screenshots.

6 Insgesamt ist der aufbereitete Text besser als der Ausgangstext.	☐	☐	☐	☐	☒	☐

Ticket 2 · Fehlerbericht

Ausgangstext

Titel. Mentions in the middle of a comment start a run

Beschreibung. @dev-assist

If I mention Dev-Assist somewhere in a sentence it already starts. That should only happen at the beginning.

Rückfragen und Antworten

Dev-Assist: More information needed

1. Should Dev-Assist start only when @dev-assist is the first content of the issue description or comment, or also when it appears later in the text?
2. Should a mention in the issue title be enough to start a run, or only a mention in the description or a comment?

Antworten

1. Only when it is the first content of the description or comment.
2. A mention in the title should not start a run.

Aufbereiteter Text

Titel. Start Dev-Assist only from a leading mention in description or comment

Description. Dev-Assist should start an analysis only when @dev-assist is the first content of an issue description or comment, so that talking about the bot in a sentence does not trigger a run. Mentions later in the same text and mentions that appear only in the issue title should be ignored. Leading whitespace or simple markdown before the mention may still count as a valid start.

Acceptance Criteria. A description or comment whose first content line starts with @dev-assist starts analysis. A mention later in the same text does not start analysis. A mention only in the issue title does not start analysis. Leading whitespace or simple markdown before @dev-assist still starts analysis. Existing explicitly started runs are unchanged.

Technical Context & Logs. The current issue reports that a mention anywhere already starts a run. Clarification: only the first content line of description or comment is a valid start; the title is not. Assumption: blank lines before the first content line are ignored when deciding whether the mention is leading.

Proposed Solution. 1. Restrict mention detection to the first content line of the description or comment. 2. Ignore title-only mentions. 3. Keep tolerance for leading whitespace and simple markdown. 4. Add tests for a leading mention, a mid-text mention, a title-only mention, and a markdown prefix. 5. State the rule in the comment posted when a run starts.

Ticket 3 · Technische Aufgabe

Ausgangstext

Titel. Failed analysis leaves the issue silent

Beschreibung. @dev-assist

When analysis fails I get no comment at all. That should work better.

Rückfragen und Antworten

Dev-Assist: More information needed

1. Should a failure be posted as a comment in the issue, or only recorded in the server log?
2. Should the comment name the failing step in plain language (GitLab, model, or storage), or only say that analysis could not be completed?

Antworten

1. Post a comment in the issue.
2. Name the failing step in plain language, without secrets or stack traces.

Aufbereiteter Text

Titel. Post a plain-language failure comment when analysis cannot complete

Description. When analysis cannot complete, Dev-Assist should post a comment in the same GitLab issue instead of staying silent. The comment should name the failing step in plain language (GitLab, model, or storage) so the requesting person knows what went wrong. Secrets, tokens, and stack traces must not appear in the comment. Server logs may still hold the detailed error.

Acceptance Criteria. If analysis fails, the issue receives a Dev-Assist comment. The comment names the failing step in plain language (GitLab, model, or storage). The comment does not contain secrets, tokens, or stack traces. If analysis succeeds, no failure comment is posted. A later successful retry can add a normal result comment in the same issue.

Technical Context & Logs. The current issue reports that a failed analysis leaves the issue without any comment. Clarification: failures must be visible in the issue, and the failing step should be named without internals. Assumption: the application already distinguishes GitLab, model, and storage errors well enough to map them to these three labels.

Proposed Solution. 1. After a failed analysis, write a comment to the issue. 2. Map the error to one of GitLab, model, or storage. 3. Format a short plain-language sentence without secrets or stack traces. 4. Keep the detailed error in the server log only. 5. Add tests for GitLab failure, model failure, storage failure, and the successful path.
